POLYFLEX®

SOFTCOAT®

Plates combining line work and screens present a great challenge to flexo printers.

Our seamless, mechanically applied polymer surface POLYFLEX® **SOFTCOAT®** is particularly suitable for these difficult jobs.

- Unlike similar surfaces that have been wound on (applied manually), you do not get the "spiral" effect showing up in the print where the wound material butts up.
- The use of cushion tapes is unnecessary, saving you money in the plate mounting process.
- The surface pores of this material are very fine enabling optimal adhesion with standard tapes.

● The high compressibility of the surface reduces plate deformation during the printing process allowing you to combine line and screen work on one printing plate.

- Sleeves with POLYFLEX® **SOFTCOAT®** surface are also available in a conductive version *.
